Dashboard Overview

Welcome to this example sales and marketing dashboard. This dashboard has been designed to showcase how a company selling clothing both online and in physical stores could track key performance metrics across channels and regions.

Note: *All data in this dashboard is synthetically generated for demonstration purposes. As such, patterns or correlations in the data may not reflect real-world performance.*

Depending on the specific needs of a company, the pages presented here could be combined into a single dashboard or presented as separate dashboards. The dashboard is organized into the following pages:

1. Daily Check

This page provides a high-level view of daily performance metrics, allowing the team to quickly check whether ongoing campaigns and marketing activities are delivering the expected results.

2. Digital Sales

This page helps the marketing and product teams understand how Web and App channels contribute to revenue, how users move through each stage of the funnel, and where potential friction impacts conversion.

3. Online Demand vs Retail Presence

This page visualizes online and retail sales on a map, enabling location-based analysis and helping to identify potential areas for new store openings or digital marketing focus.

Daily check

Channel

14 sie 2025 - 14 lis 2025

This page provides a quick overview of current sales performance. This month's total for transactions and revenue give an instant snapshot, while daily charts help the marketing team track the impact of recent campaigns. The category and regional tables show which collections and which provinces respond best to ongoing promotions, making it easy to evaluate and adjust marketing efforts in near real time.

Online Demand vs Retail Presence

This page visualizes the geographic distribution of online orders across Poland using a hexagonal density map and highlights the locations of our physical stores. It helps identify regions with strong online demand, evaluate how the presence of retail stores affects digital sales, and uncover potential areas for future store expansion.

Note: Since this dashboard uses synthetic sample data, a clear rectangular pattern is visible on the map, and for the same reason the correlation between online sales and store locations is not apparent.
